Troubleshooting Network Connectivity Issues

1. Check physical cable connections. Ensure your Ethernet cable is plugged into both the device and the wall socket securely.
2. Restart your router and modem. Disconnect power cables, wait 30 seconds, and reconnect.
3. Flush your local DNS cache. Open command prompt and run: 'ipconfig /flushdns'.
4. Reset the local TCP/IP stack. Run: 'netsh int ip reset' in an administrator shell, then restart your PC.
